CATCHING GRB ORPHAN AFTERGLOWS FROM GAIA TRIGGERS

S.D.Vergani & collaborators

Special thank to: J. Japelj & G. Ghirlanda

Short

Long

prompt emission
gamma rays
 $t \sim 1-100s$

relativistic shocks

afterglow from X to radio
 $t \sim \text{hours}$

GAMMA-RAY BURSTS

Ultra-relativistic jets associated with black holes formation

merging of compact objects

massive star explosion

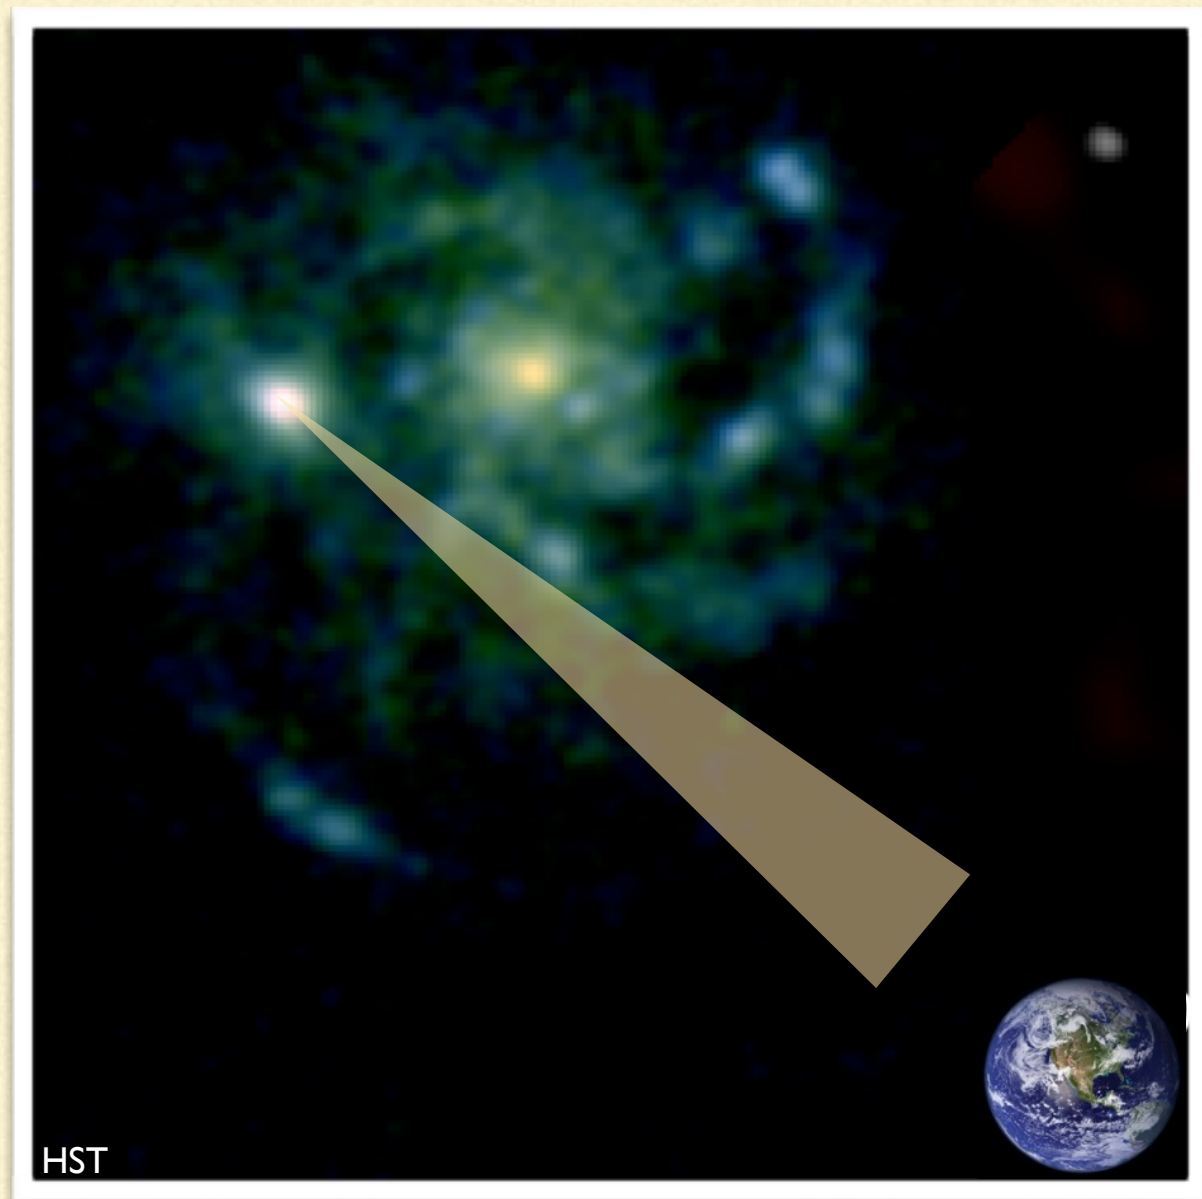

LGRBs / CCSNe connection

LONG GRBS ASSOCIATED WITH
SN TYPE IC-BL

LONG GRBS ASSOCIATED WITH
MASSIVE STARS

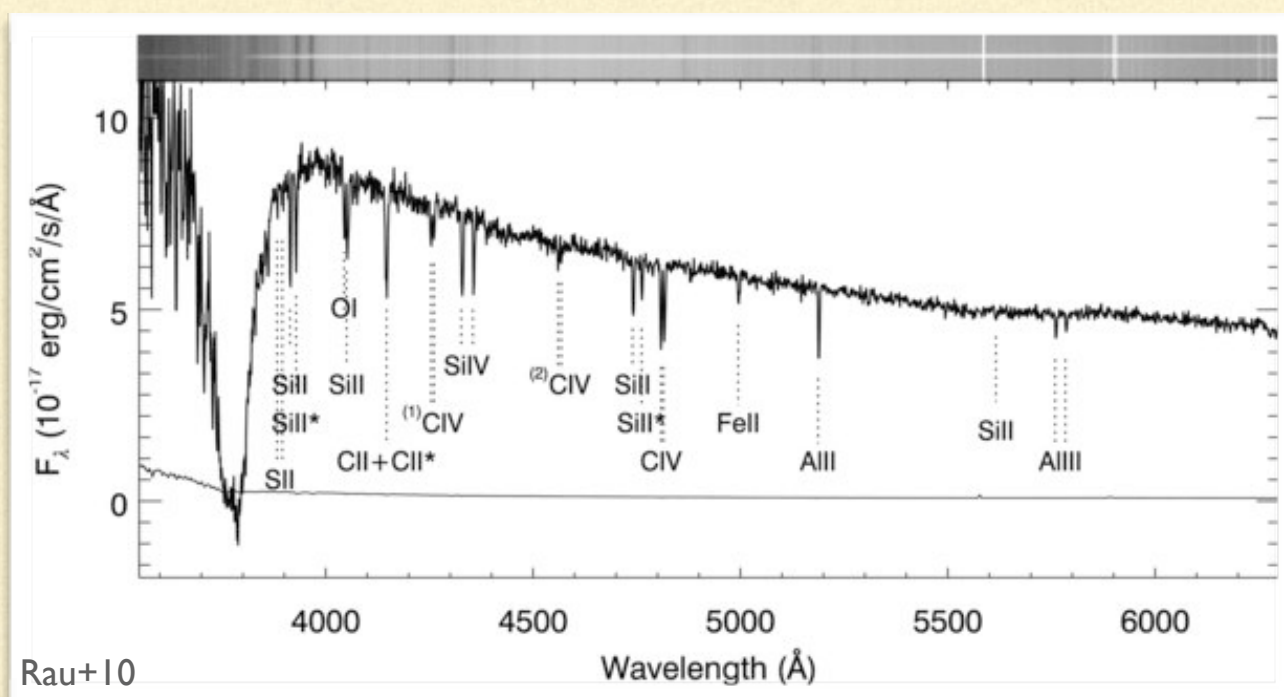

AFTERGLOW SPECTROSCOPY

- Study the disk / star-forming region gas

AFTERGLOW SPECTROSCOPY

- Study the disk / star-forming region gas

AFTERGLOW SPECTROSCOPY

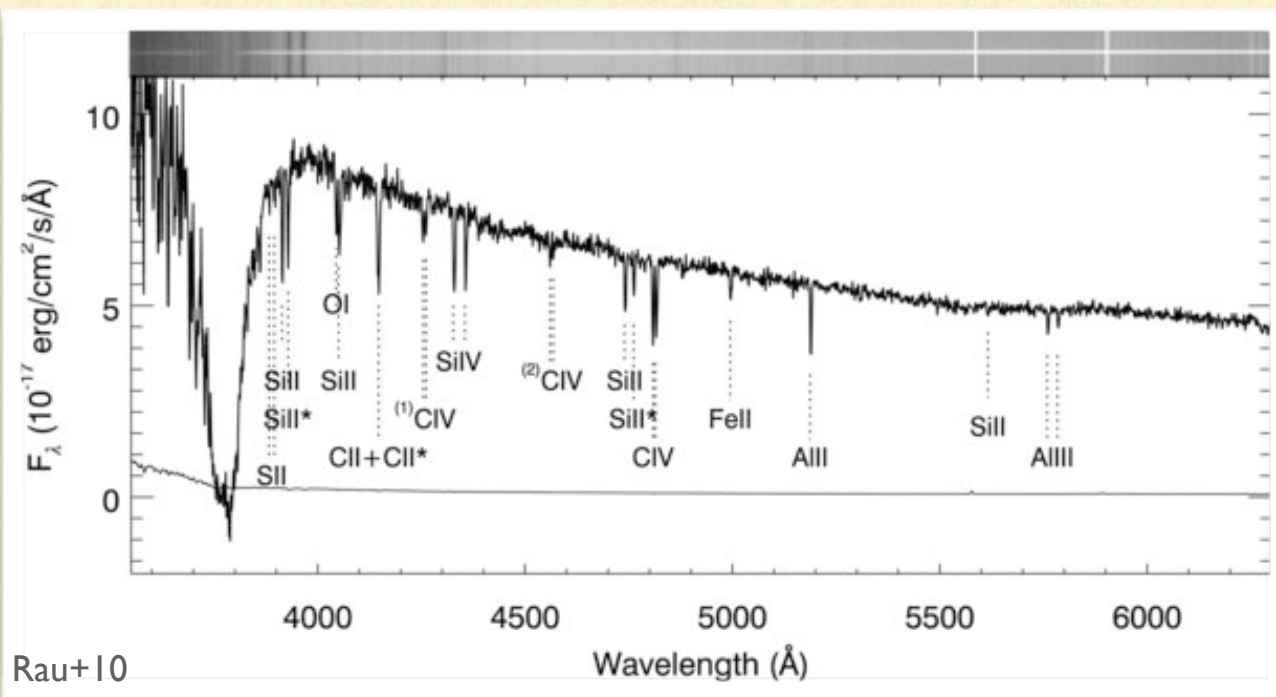

- at any z ! (record holder $z=8.2$)

AFTERGLOW SPECTROSCOPY

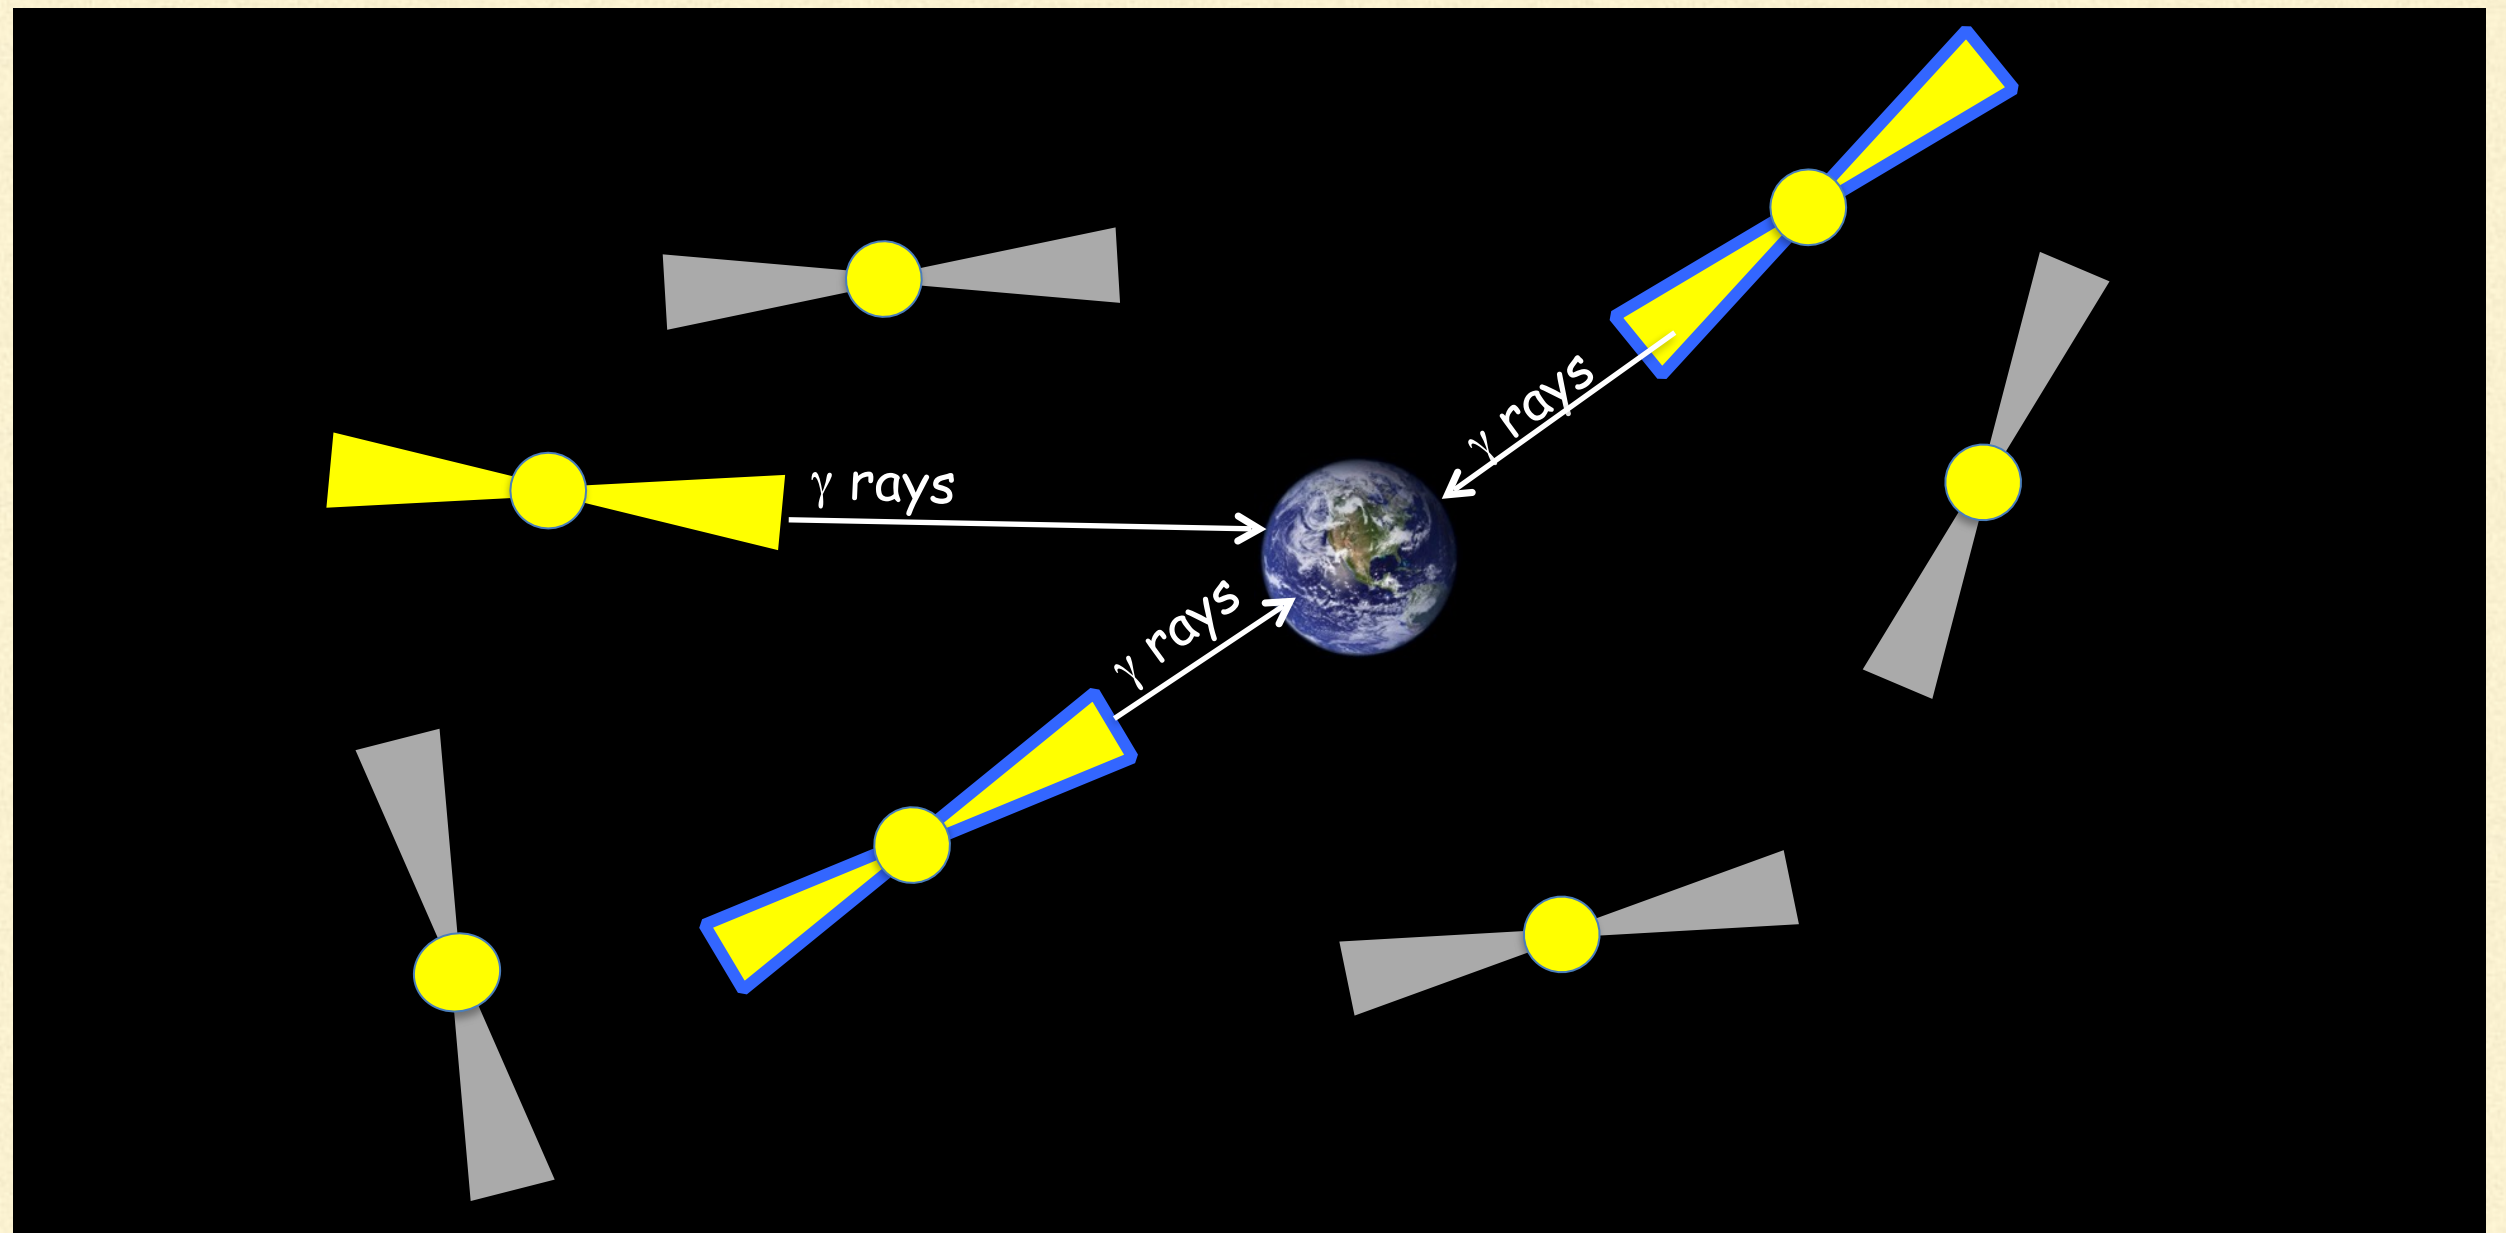

- at any z ! (record holder $z=8.2$)

AFTERGLOW SPECTROSCOPY

- Study the disk / star-forming region gas
- Time variation of fine structure lines : gas cloud distances
- $> 50\text{pc}$ (hard X-ray ionisation at smaller radii)

Courtesy of G. Ghirlanda

GAMMA-RAY BURST ORPHAN AFTERGLOWS

$N_{\text{orph}} \sim N_{\text{grb}}(2/\theta^2)$

~300 orphan afterglows for each on-axis GRB!

ORPHAN AFTERGLOWS & SURVEYS

Gaia can see them!

THE IMPORTANCE OF ORPHAN AFTERGLOWS

- to confirm the GRB jet model
 - to put constraints on the jet opening angle and structure
 - Not (or less) affected by hard-X rays:
unique access to the pristine gas surrounding massive stars at any z !
 - GW
-

HOW CAN WE RECOGNIZE THEM?

- First hints with light-curve
 - Optical spectroscopy: z, continuum, H I & metal absorption line, fine structures lines
 - we had a VLT ToO program with X-Shooter, now DDT?
 - we need to improve the Gaia Alert Pipeline and flags!
-

SUGGESTIONS FOR GAIA ALERTS

- As fast response as possible (automatised after downloading?)
 - include the following info in the Alert (script readable): blue/red, hostless?, last non-detection
 - access to light curves
-

CONCLUSIONS

- GRB orphan afterglow detection will bring unique info on GRB models
 - GRB orphan afterglow detection will give unique access at any z to the pristine gas surrounding massive stars
 - we can obtain VLT ToO observations: we need to improve the Gaia Alert Pipeline and flags!
-
